Spatial Computing and Cellular Automata
■ Massively Distributed Systems $\Rightarrow$ Spatial Features

## Introduction

Spatial Computing and Cellular Automata
■ Massively Distributed Systems $\Rightarrow$ Spatial Features
■ Why? Physics and Locality

## Introduction

Spatial Computing and Cellular Automata
■ Massively Distributed Systems $\Rightarrow$ Spatial Features
■ Why? Physics and Locality
■ Exemple? Computer Architecture, Communication

## Introduction

## Spatial Computing and Cellular Automata

- Spatial Computing: focus on space
- Cellular Automata: simple framework, precise results

## Global Statement

In the same manner that geometry is deeply based on distances, basing spatial algorithmics on the intrinsic metric of the spatial computers leads to more precise and generic formulation.

## Outline

## 1 Space, Time, and Cellular Automata

2 Distance Fields and Gradients

3 Density Uniformisation

4 Convex Hulls

5 Gabriel graphs

6 Conclusion and Perpectives

## Space, Time, and Cellular Automata

## -Space, Time, and Cellular Automata

LClassical Considerations

## Cellular Automata

## Cellular Automata

- Regular lattice of cells, also called sites, (or points)
- All sites states are updated synchronously

■ State updates depends only on neighborhood sites states

Hexagonal

## $\square_{\text {Space, Time, and Cellular Automata }}$

-Classical Considerations

## Cellular Automata

## Cellular Automata

- Regular lattice of cells, also called sites, (or points)

■ All sites states are updated synchronously
■ State updates depends only on neighborhood sites states

8-Square

Hexagonal

## Cellular Automata

## Cellular Automata

- Regular lattice of cells, also called sites, (or points)
- All sites states are updated synchronously

■ State updates depends only on neighborhood sites states

4-Square 8-Square Hexagonal

## Cellular Automata and Distances

## Directions and Distances

- Traditionnaly, neighbors are named North, South, East, West

■ In this work, no direction, only the graph and its metric

- Distances only $\Leftrightarrow$ Rotational invariance

8-Square

Hexagonal

# Distance Fields and Gradients 

## Classical Definition and Computation

## Definition (Distance Map)

The distance map $D_{P}$ of a given set of particles $P$ associates to each point $x$ its distance $d(x, y)$ to the closest particle $y \in P$.

$$
D_{P}(x)=d(P, x)=\min \{d(x, y) \mid y \in P\}
$$

## Classical Distance Field

$$
D[P]_{t+1}(x)=\left\{\begin{array}{l}
0 \text { if } x \in P_{t} \text { else: } \\
\min \left\{1+D[P]_{t}(y) \mid y \in N(x)\right\}
\end{array}\right.
$$

## — Distance Fields and Gradients

-From Infinite To Finite Field

## From Infinite To Finite Field (Cont.)

## Modulo in action

- Particles maximal speed determines maximal gradient

■ In this case: 2 consecutive moves $\Rightarrow$ gradient bound of 3

## - Distance Fields and Gradients

LFrom Infinite To Finite Field

## From Infinite To Finite Field (Cont.)

## Modulo in action

■ Particles maximal speed determines maximal gradient

- In this case: gradient bound of $3 \Rightarrow$ modulo 7

## Building on top of distances

## Distance fields as building blocks

■ Moving according to the distance field

- Detecting patterns of distances and particles

## Case Study

- Density Uniformisation (unidimensional)
- Convex Hull (multidimensional)

■ Gabriel Graph (multidimensional)

## Density Uniformisation

## L Density Uniformisation

L Problem Statement

## Problem Statement

## Problem Definition

■ Move the particles to a uniform distribution
■ Input:

- Output:

## Problem Analysis

## Intuition

■ Each particle needs to occupy its space

- Boundary between individual spaces $\Leftrightarrow$ middles

■ Occupy its space $\Leftrightarrow$ be at the middles

## - Density Uniformisation

- Problem Analysis

## Application: 1D Uniformisation

## Solution

## L Density Uniformisation

$L_{\text {Solution Description }}$

## The resulting system

## Initial system state

$$
\left\{\begin{aligned}
\mathrm{p}_{0}(x) & =x \in P \\
\mathrm{w}_{0}(x) & =x \notin P
\end{aligned}\right.
$$

## System fields composition

$$
\left\{\begin{aligned}
\mathrm{dp} & =D[\mathrm{p}] \\
\mathrm{dw} & =D[\mathrm{w}] \\
\mathrm{p} & =M\left[\mathrm{p}_{\mathrm{p}}, B[\mathrm{dp}] \wedge \operatorname{Dir}[\mathrm{dw}, \leq]\right] \\
\mathrm{w} & =M\left[\mathrm{w}_{0}, B[\mathrm{dw}] \wedge \operatorname{Dir}[\mathrm{dp}, \leq]\right]
\end{aligned}\right.

## Delaunay graph ?

## Proximity Graph Characterisation

## Delaunay graph ? No, only a subset

## Proximity Graph Characterisation

## Gabriel Graph !

## Gabriel graphs

## - Gabriel graphs

- Original Gabriel graphs

## Original Gabriel graphs

## Definition (Gabriel Graph)

- Euclidean spaces
- Connects two particles $x$ and $y$ if and only if the ball using the segment $[x y]$ as diameter does not contain any other particle.

## Gabriel graphs on Cellular Spaces

■ Connected for Euclidean... and for cellular spaces ?

## - Gabriel graphs

- Original Gabriel graphs

## Gabriel graphs on Cellular Spaces

(a) Each point

(b) Each line

(c) Each diagonal

(d) Subcase of (c)

## Generalisation

■ Connectedness is not ensured in general

- The cause is the non-uniqness of diameters and minimal balls
- We need to generalize the definition

## LGabriel graphs

$L_{\text {Metric Gabriel Graphs }}$

## Principles of Gabriel Graphs

## Connectedness, Minimality, and Locality

■ Minimality and connectedness:
■ minimum spanning trees
■ Locality and connectedness :

- arbitrarily choice implies global coherence
- union of all minimum spanning trees
- Locality and minimality :

■ Edge decision should be local
■ union of all local minimum spanning trees

## L Gabriel graphs

L Metric Gabriel Graphs

## From Principles to Definition

## Definition (Metric Gabriel Graph)

- Any metric space
- Connects two particles $x$ and $y$ if and only if there is a ball $B(c, r)$ such that $d(x, y)=2 r$ and $\{x, y\}$ is an edge of a minimum spanning tree of $P \cap B(c, r)$.

## L Gabriel graphs

$\left\llcorner_{\text {Metric Gabriel Graphs }}\right.$

## From Principles to Definition (Cont.)

## Definition (Metric Gabriel Graph)

- Any metric space
- Connects two particles $x$ and $y$ of $P$ if and only if there is a ball $B(c, r)$ such that there is a cut $\left\{P_{0}, P_{1}\right\}$ of $P \cap B(c, r)$ with $(x, y) \in P_{0} \times P_{1}$ and $d\left(P_{0}, P_{1}\right)=2 r$.

## From Principles to Definition (Cont.)

## Definition (Metric Gabriel Graph)

- Any metric space
- Connects two particles $x$ and $y$ of $P$ if and only if there is a ball $B(c, r)$ such that there is a cut $\left\{P_{0}, P_{1}\right\}$ of $P \cap B(c, r)$ with $(x, y) \in P_{0} \times P_{1}$ and $d\left(P_{0}, P_{1}\right)=2 r$.

## Preservation of the Properties

- Metric Gabriel graphs are always connected

■ On Euclidean spaces, they are Gabriel graphs

$r=3$

## The metric Gabriel ball centers field

$$
\operatorname{cent}_{t}(x)=\left\{\begin{array}{l}
\perp \text { if } t=0 \\
\top \text { if } \overline{\operatorname{cent}}_{t}(x, x) \\
\top \text { if } \exists y \in N(x), \overline{\operatorname{cent}}_{t}(x, y) \\
\perp \text { otherwise; }
\end{array}\right.
$$

$$
\begin{aligned}
\overline{\operatorname{cent}}_{t}(x, y) & =\left|\bar{Q}_{t}(x, y) / C_{2 r_{x y}}^{+}\right| \geq 2 \\
\bar{Q}_{t}(x, y) & =\left\{z \in B\left(x y, r_{x y}\right) \mid D[P]_{t-1}(z)+r_{x y}=\bar{D}[P]_{t-1}(x, y)\right\}
\end{aligned}
$$
