## Discrete dynamical systems

Definition A DDS is a pair $(X, F)$ where $X$ is a topological space and $F: X \rightarrow X$ is a continuous map.

Definition The orbit of $x \in X$ is the sequence $\left(F^{n}(x)\right)$ obtained by iterating $F$.

In this talk, $X=S^{\mathbb{Z}}$ is endowed with the Cantor topology (product of the discrete topology on $S$ ), and $F$ is a continuous map invariant by translation.

## Cantor topology

Definition The Cantor topology on $S^{\mathbb{Z}}$ is the product topology over $\mathbb{Z}$ of the discrete topology on $S$.

Remark The Cantor topology is metric and compact.

$$
\forall c, c^{\prime} \in S^{\mathbb{Z}}, d\left(c, c^{\prime}\right)=2^{-\min \left\{|p| \mid c_{p} \neq c_{p}^{\prime}\right\}}
$$

$$
d\left(c, c^{\prime}\right)=1 / 8
$$

Definition A subshift is a non-empty set both topologically closed and closed by translation.

## The nilpotency problem (Nil)

Definition A DDS is nilpotent if $\exists z \in X, \forall x \in X, \exists n \in \mathbb{N}, F^{n}(x)=z$.

Given a recursive encoding of the DDS, can we decide nilpotency?

A DDS is uniformly nilpotent if $\exists z \in X, \exists n \in \mathbb{N}, \forall x \in X, F^{n}(x)=z$.

Given a recursive encoding of the DDS, can we bound recursively $n$ ?

## The periodicity problem (Per)

Definition A DDS is periodic if $\forall x \in X, \exists n \in \mathbb{N}, F^{n}(x)=x$.

Given a recursive encoding of the DDS, can we decide periodicity?

A DDS is uniformly periodic if $\exists n \in \mathbb{N}, \forall x \in X, F^{n}(x)=x$.

Given a recursive encoding of the DDS, can we bound recursively $n$ ?

## 1. Cellular Automata

## Cellular automata

Definition A CA is a triple $(S, r, f)$ where $S$ is a finite set of states, $r \in \mathbb{N}$ is the radius and $f: S^{2 r+1} \rightarrow S$ is the local rule of the cellular automaton.

A configuration $c \in S^{\mathbb{Z}}$ is a coloring of $\mathbb{Z}$ by $S$.

The global map $F: S^{\mathbb{Z}} \rightarrow S^{\mathbb{Z}}$ applies $f$ uniformly and locally:

$$
\forall c \in S^{\mathbb{Z}}, \forall z \in \mathbb{Z}, \quad F(c)(z)=f(c(z-r), \ldots, c(z+r))
$$

A space-time diagram $\Delta \in S^{\mathbb{N} \times \mathbb{Z}}$ satisfies, for all $t \in \mathbb{Z}^{+}$,

$$
\Delta(t+1)=F(\Delta(t))
$$

## Space-time diagram

$$
S=\{0,1,2\}, r=1, f(x, y, z)=\left\lfloor 6450288690466 / 3^{9 x+3 y+z}\right\rfloor(\bmod 3)
$$

## Turing universality

Theorem There exists Turing-universal CA.

## Curtis-Hedlund-Lyndon's theorem

$$
[m]=\left\{c \in S^{\mathbb{Z}}|\forall p \in \mathbb{Z},|p| \leqslant r \Rightarrow c(p)=m(p)\}\right.
$$

Remark The clopen sets are finite unions of cylinders.

Therefore in this topology continuity means locality.

Theorem [Hedlund69] Cellular automata coincide with continuous maps invariant by translation.

## Undecidability results

Theorem Both Nil and Per are recursively undecidable.

The proofs inject computation into dynamics.

Undecidability is not necessarily a negative result: it is a hint of complexity.

Remark Due to universe configurations both nilpotency and periodicity are uniform.

The bounds grow faster than any recursive function: there exists simple nilpotent or periodic CA with huge bounds.
2. Nilpotency and tilings

## The Domino Problem (DP)

"Assume we are given a finite set of square plates of the same size with edges colored, each in a different manner. Suppose further there are infinitely many copies of each plate (plate type). We are not permitted to rotate or reflect a plate. The question is to find an effective procedure by which we can decide, for each given finite set of plates, whether we can cover up the whole plane (or, equivalently, an infinite quadrant thereof) with copies of the plates subject to the restriction that adjoining edges must have the same color."
(Wang, 1961)

## Undecidability of DP

Theorem[Berger64] DP is recursively undecidable.

Remark To prove it one needs aperiodic tile sets.
Idea of the proof
Enforce an (aperiodic) self-similar structure using local rules.

Insert a Turing machine computation everywhere using the structure.

Remark Plenty of different proofs!

## Nilpotency and limit set

Definition The limit set of a CA F is the non-empty subshift

$$
\Lambda_{F}=\bigcap_{n \in \mathbb{N}} F^{n}\left(S^{\mathbb{Z}}\right)
$$

Remark $\Lambda_{F}$ is the set of configurations appearing in biinfinite space-time diagrams $\Delta \in S^{\mathbb{Z} \times \mathbb{Z}}$ such that $\forall t \in \mathbb{Z}, \Delta(t+1)=F(\Delta(t))$.

Lemma A CA is nilpotent iff its limit set is a singleton.

## Reduction

A state $\perp \in S$ is spreading if $f(N)=\perp$ when $\perp \in N$.
A CA with a spreading state $\perp$ is not nilpotent iff it admits a biinfinite space-time diagram without $\perp$.

A tiling problem Find a coloring $\Delta \in(S \backslash\{\perp\})^{\mathbb{Z}^{2}}$ satisfying the tiling constraints given by $f$.

Theorem[Kari92] NW-DP $\leqslant_{m}$ Nil

## Revisiting DP

## Theorem[Kari92] NW-DP is recursively undecidable.

Remark Reprove of undecidability of DP with the additionnal determinism constraint!

Corollary Nil is recursively undecidable.
2. Nilpotency and tilings

## 3. Periodicity and mortality

## The Immortality Problem (IP)

" $\left(T_{2}\right)$ To find an effective method, which for every Turing-machine $M$ decides whether or not, for all tapes I (finite and infinite) and all states $B, M$ will eventually halt if started in state B on tape I"

Definition A TM is a triple ( $S, \Sigma, T$ ) with $S$ the set of states, $\Sigma$ the alphabet and $T$ a set of instructions of two kinds:
$(s, \delta, t):$ "in state $s$ move in direction $\delta$ and enter state $t$."
$(s, a, t, b):$ "in state $s$, reading letter $a$, write letter $b$ and enter state $t$."

A configuration $\mathfrak{c} \in S \times \Sigma^{\mathbb{Z}}$ is a pair $(s, c)$ where $s$ is the state and the head points at position 0 of the tape $c$.

For deterministic TM, the global map $G: S \times \Sigma^{\mathbb{Z}} \rightarrow S \times \Sigma^{\mathbb{Z}}$ which applies instructions is a partial continuous map.

## Undecidability of IP

Definition A TM is mortal if all configurations are ultimately halting.

Theorem[Hooper66] IP is recursively undecidable.

Remark To prove it one needs aperiodic TM.

Idea of the proof
Simulate 2 -counters machines à la Minsky $\left(s, @ 1^{m} \times 2^{n} y\right)$
Replace unbounded searches by recursive calls to initial segments of the simulation.

## Periodicity and reversibility

Definition A CA $F$ is reversible if there exists a CA $G$ such that $G=F^{-1}$.

Theorem A CA is reversible iff it is bijective.

Remark Periodicity implies reversibility.

Definition A TM $(S, \Sigma, T)$ is reversible if $\left(S, \Sigma, T^{-1}\right)$ is deterministic, where

$$
\begin{aligned}
(s, \delta, t)^{-1} & =(t, \delta, s) \\
(s, a, t, b)^{-1} & =(t, b, s, a)
\end{aligned}
$$

## Reduction

## Theorem[KO2008] R-IP $\leqslant m$ TM-Per $\leqslant m$ Per

Idea for TM-Per $\leqslant m$ Per
Let $\mathcal{M}=(S, \Sigma, T)$ be a complete RTM
Let ( $S^{\prime}, 2, f$ ) be the RCA with set of states
$\Sigma \times(S \times\{+,-\} \cup\{\leftarrow, \rightarrow\})$ simulating $\mathcal{M}$ on + and $\mathcal{M}^{-1}$ on - . In case of local inconsistency, invert polarity.
The RCA is periodic iff $\mathcal{M}$ is periodic.

## Revisiting IP

Theorem[KO2008] R-IP is recursively undecidable.

Remark Reprove of undecidability of IP with the additionnal reversibility constraint!

Corollary TM-Per and Per are recursively undecidable.

## Program it!

## 1. Cellular Automata

2. Nilpotency and tilings
3. Periodicity and mortality

4. Open problems

## Conclusion

We have proven the undecidability of dynamical properties.
The results extend to larger families of dynamical properties.
We consider the behaviour of the model starting from arbitrary initial configurations.

We use variations of two problems (DP and IP) introduced by Büchi and Wang to solve the $\forall \exists \forall$ class of the classical decision problem and later proven undecidable by Berger and Hooper, two PhD students of Wang.

## Open Problem

Definition A CA $F$ is positively expansive if

$$
\exists \varepsilon>0, \forall x \neq y, \exists n \geqslant 0, d\left(F^{n}(x), F^{n}(y)\right) \geqslant \varepsilon
$$

Question Is positive expansivity decidable?
